YOUR **INTELLIGENT SHOPPING** AGENT

Redesigning the Personalization Loop

A first-hand product teardown of Glance AI, the world's first AI-native, inspiration-led commerce platform.

by Akshay Sinha

Aspiring Product Manager | May 2026

01

What is Glance AI?

Launched May 2025 by InMobi Group and backed by Google. An AI-native fashion commerce platform that turns selfies into hyper-personalized, shoppable looks. 1.5M US trial users, 50% weekly return.

02

Where it still hurts.

In hands-on testing, only ~30 to 35% of generated looks felt personally relevant. Users struggle to describe taste in words, can't import inspiration from Instagram or Pinterest, and can't modify partial outfits.

03

What I'm arguing.

Glance AI does not need better image generation. It needs better signal capture, inspiration-native workflows, and modular co-creation, before generation begins.

01 Context — Product, market, competitors →

02 Architecture — The 3-layer AI system →

03 Personas — Who shops, and how they shop today →

04 Frictions — Where Glance AI hurts today →

05 Prioritiization — Where to invest, and why →

06 Solutions — Three designs to redesign the loop →

07 Future State — The Glance AI journey, reimagined

Improving Personalized Browsing Experience in Glance AI

Reimagining fashion discovery through AI-powered inspiration commerce.

The bottleneck in fashion shopping isn't choice — it's inspiration.

glance ai

1 What is Glance AI?

Glance AI is an inspiration-commerce platform that generates personalized fashion experiences using generative AI.

Glance AI

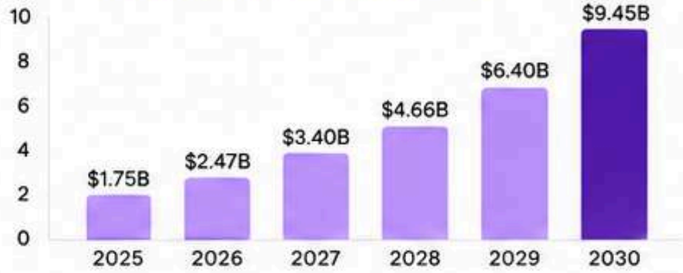

Traditional Commerce	Inspiration Commerce
Search-led	Discovery-led
Catalog browsing	AI-generated personalization
Transaction-first	Identity-first

2 Market Opportunity

AI in Fashion Market

- **$1.75B** market in 2025
- Projected to reach $9.45B by 2030
- ~39.8% CAGR (2025–2030)

AI in Fashion Market Size (USD Billion)

Key Drivers

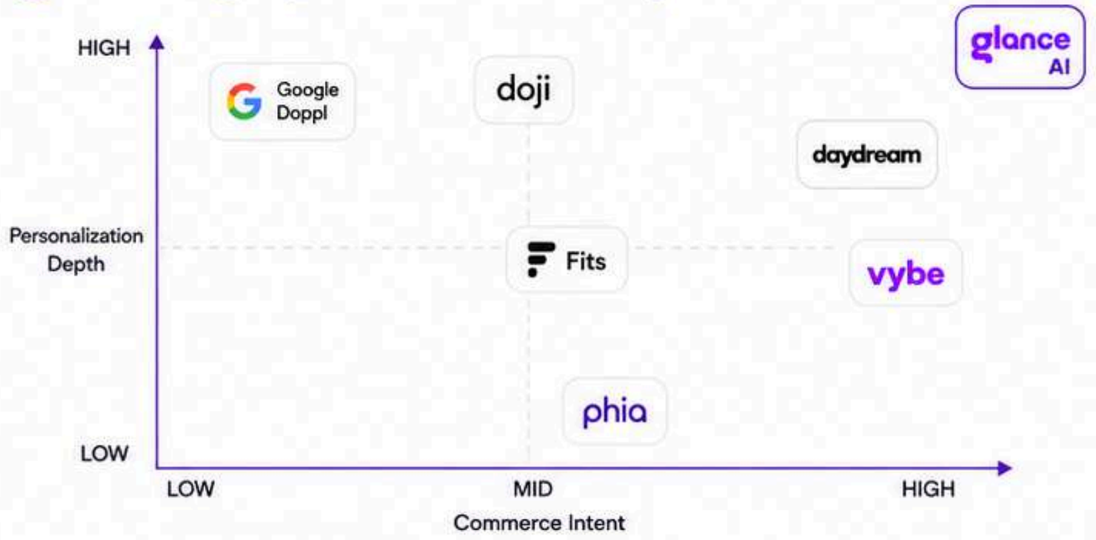

- Rise of AI personalization
- Gen Z inspiration-led shopping
- E-commerce growth

North America was the largest region in 2025 and Asia-Pacific is the fastest growing region.

3 Key Players

Google Doppl · doji · Fits · vybe · daydream · phia

4 Positioning Map — AI-Native Fashion Players

5 Glance AI's Potential Moat

- Lock-screen distribution
- Personalization data graph
- AI-generated visualization
- Continuous feedback learning

6 Problem Statement

AI outfit generation is computationally expensive — and irrelevant generations waste both user attention and compute budget.

This creates:

- Browsing fatigue
- Irrelevant recommendations
- Lower retention
- Wasted compute cost

PM Goal

Improve personalized browsing relevance while balancing exploration, personalization quality, and compute efficiency.

2 How Glance AI Personalizes Fashion Discovery

My teardown of how Glance AI likely combines recommendation intelligence, multimodal generation, and behavioral learning to deliver personalized fashion experiences.

glance ai

LAYER 1 User Understanding & Recommendation Intelligence

Result: Glance AI knows what to show you before you know what you want.

1 Signals

Collects implicit signals to understand evolving user taste and intent.

- Profile Preferences
- Browsing History
- Likes / Skips
- Scrolling Behavior
- Virtual Try-Ons
- Recent Session Intent

2 Unified Identity Graph

Aggregates signals across multiple ecosystems to build a richer and more contextual user profile.

- Glance AI App
- Lock Screen
- Glance TV
- D2C Catalogs
- Ads Ecosystem

InMobi Identity Graph —
15+ years of cross-ecosystem behavioral data, giving Glance AI a cold-start advantage no competitor can match.

3 User Embeddings

AI representation of evolving fashion taste and preference.

4 Recommendation Intelligence Engine

Two-tower architecture to match user taste with the most relevant looks.

User Tower
- User embeddings
- Interaction history
- Recent intent
- Contextual signals

Look / Avatar Tower
- Generated looks
- Style attributes
- Aesthetics
- Visual composition

Personalized Ranking
Looks most likely to drive engagement and delight

★ Key Insight

> Glance AI is not optimizing for search relevance. It is optimizing for inspiration relevance.

LAYER 2 AI Outfit Generation Engine

Result: Every look is rendered on your body, not a model's.

Inputs
- Human Image (selfie / body)
- Garment Image (item from catalog)
- Editable Mask (define edit region)
- Prompt / Context (occasion, style, mood)

VAE Encoder
Compresses high-resolution images into latent representations for efficient processing.

Latent Representations

Text Embeddings (CLIP + T5)
CLIP · T5

Flux Transformer (Core Generation Engine)

Combines image latents + mask + text embeddings. Iteratively denoises the latent space while conditioning on the prompt and mask to generate the output.

Output

Personalized Outfit Visualizations

Optimization Layers (For Realism)

- **Garment Masking** — Isolates the garment by removing skin and background pixels from the catalog image.
- **Object Retention** — Preserves accessories, hair, and background objects by excluding them from the editable region during generation.
- **Synthetic Data Training** — Trained on large-scale synthetic datasets via advanced Stable Diffusion pipelines for diversity, and realism.

Feedback signals update embeddings

Important: Personalized generation is computationally expensive. Every irrelevant recommendation increases GPU inference cost, latency, and browsing fatigue.

LAYER 3 Continuous Feedback Learning Loop

Result: The system gets sharper with every scroll.

Dwell Time · Skips · Likes · Saves · Shares · Try-Ons · Purchases

Improves Over Time
- Better recommendation ranking
- Higher personalization quality
- More relevant outfit generation
- Stronger browsing confidence

Example User Journey

1 User Behavior

- Likes minimal aesthetics
- Skips oversized streetwear
- Recently searched "wedding outfits"

2 System Understanding

Detects:
- Stable minimalist taste
- Temporary wedding intent
- Down-weights streetwear in current session

3 Recommendation Layer

Ranks higher:
- Elegant ethnic looks
- Occasion-focused outfits
- Muted palettes

4 AI Generation

Creates personalized wedding-ready outfit visualizations.

5 Outcome

User sees relevant, high-quality looks that match both style and intent.

Final Takeaway | Glance AI's moat is not just generating outfits — it is continuously learning a user's evolving fashion identity.

3 Who Shops on Glance AI, and How They Shop Today

glance ai

Three personas, one broken journey.

Akshay, 25

The Heavy Researcher

"I've been comparing this jacket for two weeks."

Behavior

- Opens 6+ tabs to compare
- Reads every review before buying
- Cross-checks prices on 3+ sites

Pain Point

51% cite irrelevant search results as their top frustration.

Ishita, 24

The Lazy-Aspirational

"I'll buy something when I find the perfect outfit."

Behavior

- Scrolls Reels for hours
- Screenshots looks she loves
- Rarely actually purchases

Pain Point

76% discover fashion on social, but conversion happens elsewhere, days later.

Harsh, 27

The Indecisive Explorer

"I don't know if this will actually look good on me."

Behavior

- Adds to cart, removes, adds again
- Worries about fit and styling
- Returns items frequently

Pain Point

40% of fashion returns are due to fit and styling uncertainty.

The Traditional Fashion Journey, Where It Breaks

01 Instagram
Action: See a look
☹ I want THAT exact outfit

→

02 Pinterest
Action: Save ideas
☹ Saved 200, bought 0

→

03 Myntra / Ajio
Action: Search for it
☹ Can't find the exact look

→

04 Filter & Compare
Action: Size, color, price
☹ Will this fit me?

→

05 Cross-shop
Action: Check other sites
☹ Is it cheaper elsewhere?

→

06 Abandon Cart
Action: Give up
☹ Not sure anymore

The traditional journey takes 4+ hours, spans 5+ platforms, and ends in cart abandonment 79% of the time.

Glance AI compresses this entire journey into one screen.

4 Diagnosing Personalization Friction in the Current Experience

glance ai

Real onboarding and browsing observations from active product usage.

The Current Glance AI Journey

01 Onboarding — Upload selfie and initial setup — ~5 min

→

02 Preference Capture — Answer style, color, fit and lifestyle questions — 2–3 min

→

03 Generation — AI generates personalized looks — ~30 sec

→

04 Browsing — Scroll through generated outfits — ongoing

→

05 Feedback — Like, dislike and refine preferences — per look

→

06 Exploration — Explore products behind the looks — 5–10 min

→

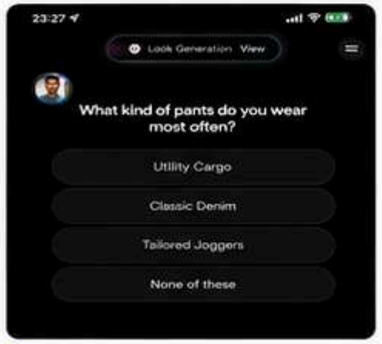

07 Purchase Intent — Checkout consideration — 2–5 min

→

Total session: 15–20 min

Key Friction Points Observed

1 Ambiguous Fashion Terminology

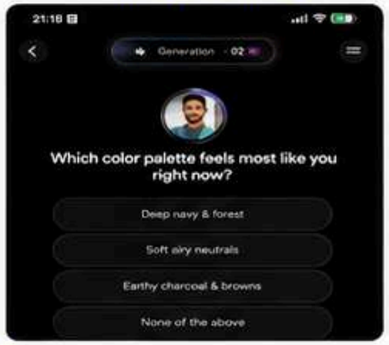

Observation
Users may not understand niche fashion terms like "utility cargo" or "tapered joggers".

Root Cause
Text-first onboarding with no visual context.

Impact
Preference signals become noisy and less accurate.

2 Single-Select Limits True Preferences

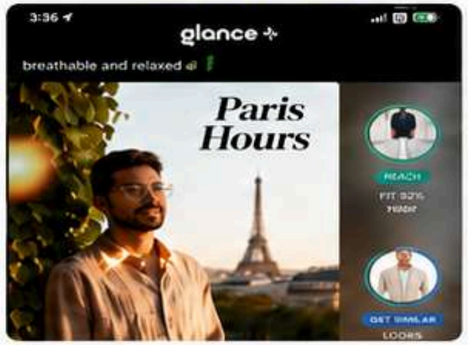

Observation
Users often resonate with multiple choices, not just one.

Root Cause
Binary, single-select question framework with no free-text or "Other" option to capture nuance.

Impact
Oversimplified user embeddings and missed nuances.

3 Low Initial Recommendations Relevance (~30–35%)

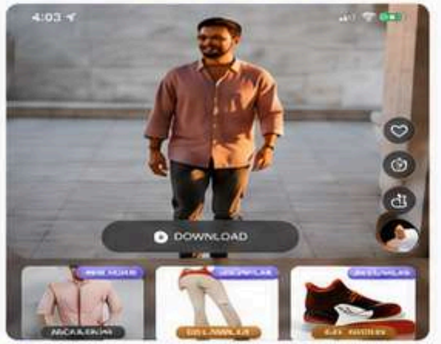

Observation
In my testing, only ~30 to 35 percent of looks felt personally relevant during onboarding.

Root Cause
Cold-start understanding is insufficient before expensive generation.

Impact
Browsing fatigue, skips increase and GPU inference cost rises.

4 Limited Controllability of Generated Looks

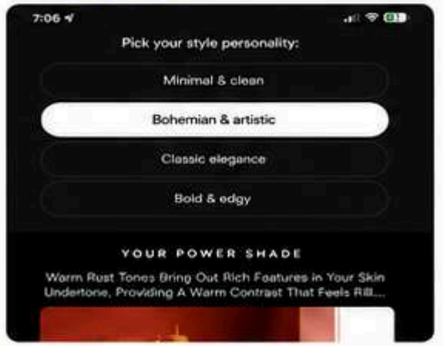

Observation
Liked the shirt but not the pants or shoes, yet there is no easy way to change individual items.

Root Cause
One-shot, full-outfit generation without modular editing.

Impact
Users abandon looks they partially love because they cannot isolate what works.

5 No Way to Import External Inspiration

Observation
Users already discover looks on Instagram, Pinterest and from celebrities.

Root Cause
No support for image upload, URL import or celeb style reference.

Impact
Missed intent signals and weaker personalization accuracy.

Users struggle to describe fashion preferences verbally, but can identify them visually in seconds.

Signals Indicating Personalization Friction

~30–35%	Initial relevance rate
High	Preference ambiguity
Medium–High	Cognitive load
High	Feedback richness
Low	Co-creation control

What's Working — Match percentage tags, free-text dislike feedback, and hyper-realistic personalized rendering are best-in-class. The product gets a lot right.

Key Takeaway

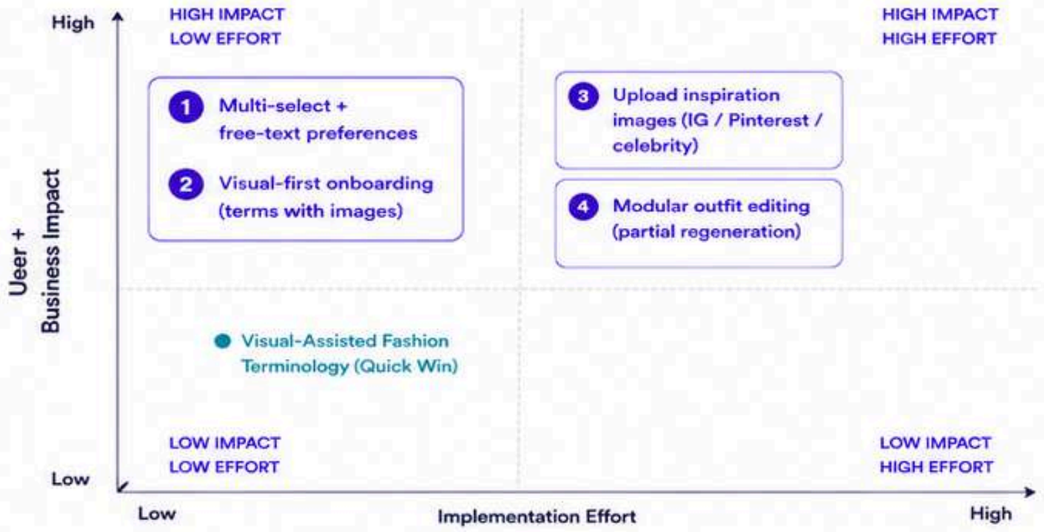

The personalization problem is not generation capability.
It is: collecting richer and more accurate preference signals before generation begins.

5 Prioritizing the Highest-Leverage Personalization Opportunities

glance ai

Not all friction points contribute equally to personalization quality, engagement, or compute efficiency.

Impact vs Effort Prioritization Matrix

Expected Impact of Prioritized Opportunities

	Opportunity	Expected Outcome
1	Richer Preference Capture	Higher initial relevance rate, stronger cold-start embeddings, lower browsing fatigue
2	Visual Inspiration Import	Faster personalization accuracy, higher intent capture, more inspiration-to-discovery conversions
3	Partial Outfit Regeneration	Higher engagement depth, lower abandonment, more time spent exploring looks
•	Visual-Assisted Fashion Terminology (Quick Win)	Lower cognitive load, fewer misunderstandings, better preference articulation

The highest-leverage improvements happen BEFORE generation, not after it.

Top 3 Prioritized Opportunity Areas

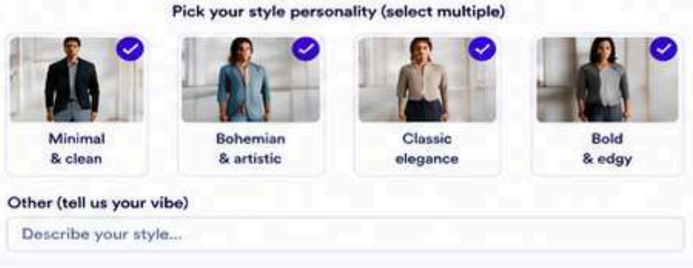

1 Richer Preference Capture — Priority: Highest

Problem
Users struggle to describe fashion preferences through text alone.

Opportunity
- Multi-select onboarding
- Free-text preference input
- Image-assisted choices for clarity

Why it Matters
Improves cold-start understanding before expensive generation begins.

Concept: Multi-select + Visual Onboarding

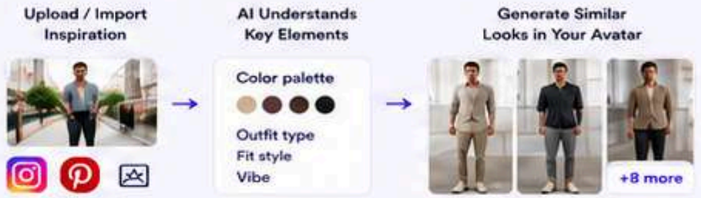

2 Visual Inspiration Import — Priority: High

Problem
Fashion inspiration already exists outside the app.

Opportunity
- Upload screenshots from Instagram, Pinterest
- Import references or celebrity looks
- Generate similar outfits on your avatar

Why it Matters
Captures high-intent visual preference signals directly.

Concept: Inspiration to Look Generation

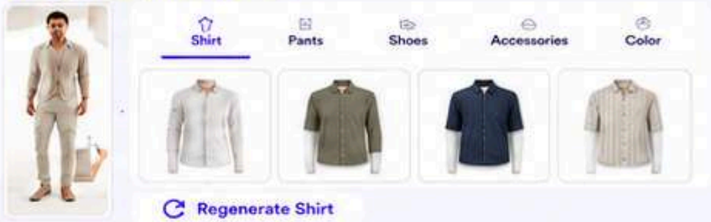

3 Partial Outfit Regeneration — Priority: High

Problem
Users may like parts of a generated look, not the entire outfit.

Opportunity
- Change shirt / pants / shoes individually
- Color variations, style swaps
- Regenerate only what user wants

Why it Matters
Recovers high-intent users who currently abandon partial-love looks. Direct conversion lift.

Concept: Modify What You Want

Prioritization Logic
Selected based on:
- Personalization impact
- Implementation feasibility
- Compute efficiency gains
- Retention potential

What's Working
Match percentage tags, free-text dislike feedback, and hyper-realistic personalized rendering are best-in-class. The product gets a lot right.

Key Takeaway

Glance AI does not need more generation capability.

It needs: richer preference signals, stronger intent understanding, and more controllable personalization workflows.

6 Redesigning the Personalization Loop

Improving preference understanding before generation to increase relevance, engagement, and conversion.

glance ai

1 Visual Preference Onboarding

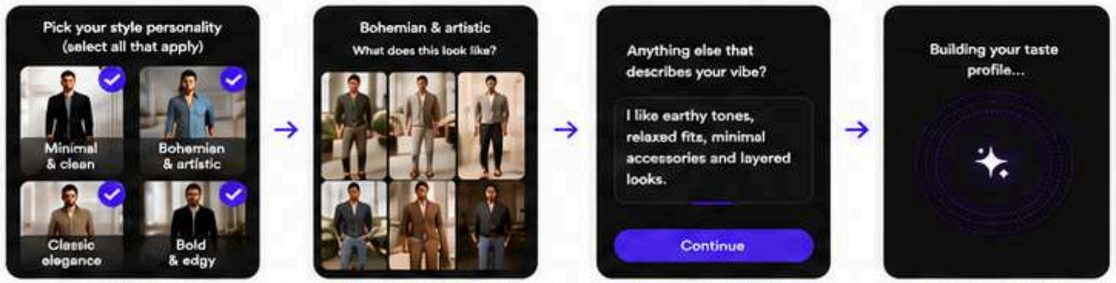

Problem

Users struggle to express fashion taste through text-only onboarding.

Solution

- Multi-select preferences
- Visual style cards
- Free-text input

New Workflow

1. Select multiple aesthetics
2. See visual examples for clarity
3. Add free-text to describe your vibe
4. AI builds richer taste embedding

Key Insight

Users recognize fashion visually faster than they can describe it verbally.

Expected Impact

- Higher cold-start relevance
- Better onboarding completion
- Lower cognitive load

2 Inspiration Import Engine

Problem

Fashion inspiration already exists outside Glance AI.

Solution

- Upload Instagram screenshots
- Import Pinterest references
- Select celebrity looks
- Generate similar styles on your avatar

New Workflow

1. Upload / import inspiration from anywhere
2. AI understands color, silhouette, vibe, layering
3. Generate similar looks on your avatar
4. Explore more variations you'll actually like

Key Insight

Glance AI should learn from existing inspiration behavior, not replace it.

Expected Impact

- Faster personalization accuracy
- Higher inspiration-to-generation conversion
- More sharing & social behavior

3 Modular Outfit Regeneration

Problem

Users often like parts of a generated outfit, not the entire look.

Solution

- Regenerate shirt / pants / shoes selectively
- Preserve liked components
- Mix and match easily

New Workflow

1. Like shirt, dislike pants
2. Choose to regenerate only the pants
3. AI updates pants while preserving the rest
4. Refine further until it feels just right

Key Insight

Users want collaborative styling, not one-shot generation.

Expected Impact

- Higher engagement depth
- Reduced abandonment
- Higher purchase intent

Why These Solutions Matter

Glance AI Today

Source: Glance Business Wire press release, May 2025

- **1.5M** US trial active users
- **50%** Weekly return rate
- **40M+** Style requests generated
- **50%** Save or share rate
- **40%** Tap-to-shop rate

Industry Validation

Source: McKinsey 2024, EY India 2024, InMobi

- Up to 35% lift in fashion conversion from personalized visual recommendations — *McKinsey 2024*
- 15% revenue uplift potential from personalization — *McKinsey 2024*
- 48% of Indian shoppers trust AI recommendations (2x global avg) — *EY India 2024*
- 49% more likely to buy with tailored recommendations — *InMobi*

Personal Testing Observations

Source: My hands-on testing of the app

- ~30–35% of generated looks felt personally relevant during onboarding
- Single-select preference framework limits richer signal capture

New Product Philosophy

From: "Generate outfits for users" → To: "Collaboratively discover personal style with users"

What's Working

Match percentage tags, free-text dislike feedback, and hyper-realistic personalized rendering are best-in-class. The product gets a lot right.

Key Takeaway

Glance AI does not need more generation capability.

It needs: richer preference signals, stronger intent understanding, and more controllable personalization workflows.

7 The Future Glance AI Journey

One thesis: better signals lead to better business.

glance ai

1 THE NEW USER JOURNEY

01 Pick your style
Select all that apply
Minimal · Bohemian · Streetwear · Classic · Y2K · Athleisure
Describe your vibe...

Onboarding NEW
Visual multi-select + free-text style discovery

02 Add inspiration
Upload or import from
Instagram
Pinterest
Celebrity

Inspiration Import NEW
Upload Instagram, Pinterest, or celebrity looks

03 Your looks
Generated for you
Save

AI Generation
Hyper-personalized looks on your avatar

04 Modify this look
Choose what to change
Shirt · Pants · Shoes
Regenerate shirt
Keep the rest as is

Modular Refinement NEW
Regenerate just what you want to change

05 Help us improve
What didn't you like?
Tell us in your own words
E.g., too casual, not my style...
Select all that apply
Too casual · Not my style · Wrong colors · Too plain · Too trendy · Other

Feedback Loop
Free-text + multi-select dislike reasons

06 Shop this look
Exact or similar items
Olive Linen Shirt $59 92% match
Beige Trousers $49 89% match
White Sneakers $69 94% match
Aviator Sunglasses $29 90% match

Shop
Tap to shop the exact or similar product

Same 15 minutes experience, dramatically higher relevance.

2 BEFORE vs. AFTER COMPARISON

Today	After These Solutions
I can't describe my style in words	I show Glance what I like
Only ~30 to 35% of looks feel right *(Source: my personal testing)*	Glance learns from richer signals before generating
Like the shirt, not the pants	Swap one piece at a time, keep the rest
Don't know what "Bohemian" or "Utility Cargo" means	Visual references remove ambiguity
My Instagram screenshots have no home in Glance	Inspiration imports become the starting point

3 STRATEGIC IMPACT

For Users
- Faster path from inspiration to a look that feels truly theirs
- Lower cognitive load through visual onboarding
- Higher confidence to actually shop (not just save)

Validated by McKinsey 2024: up to 35% lift in fashion conversion from personalized visual recommendations

For Glance AI
- Stronger retention from the 50% weekly return baseline
- Higher conversion from the 40% tap-to-shop baseline
- More users sharing looks beyond the existing 50% save/share rate

Baselines: Glance Business Wire press release, May 2025

For the AI System
- Richer preference embeddings reduce wasted generation
- Inspiration uploads add net-new signal types unique to Glance
- Modular regeneration creates a tighter feedback loop

Aligned with EY India 2024: 48% of Indian shoppers trust AI recommendations, 2x global average

What's Working
Users love the quality of looks, the feedback loop, and the overall experience.
With better input and collaboration, we can unlock the next big leap.

The future of AI fashion is not better image generation. It is better taste understanding.

Inspiration is the new intent. The product that understands that wins.
