April 2025
Acquired by Strava

Core Value Proposition

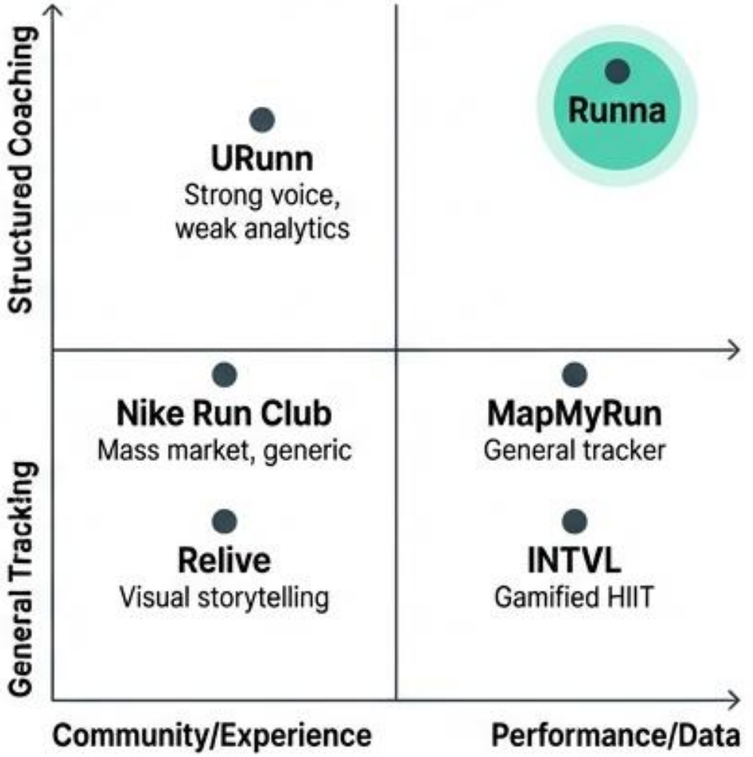

Transforms running ambition into a structured training roadmap. Removes guesswork and manual planning, replacing them with predictable improvement through structured, goal-driven race preparation (First 5k to Ultramarathon).

The 4-Step User Process

1. **Onboarding:** Input experience, race goal, target pace, and schedule
2. **Plan Generation:** App assigns weekly schedules, interval workouts, and long runs.
3. **During Run:** Audio coaching, pace reminders, and live structure.
4. **Post-Run:** Performance data, pace analysis, and completion tracking.

Competitive Matrix

Synthesis Callout: Runna's differentiation is a "Structured Performance Coach," not a general activity tracker. Its wedge is goal-driven training, but its clear gap is dynamic adaptive intelligence.

Consumer Insights: Diverse running goals, but a unified need for safe, structured progression

Rahul Sharma, 26
Software Engineer

The Beginner Goal Runner

Goal: Complete first 10K race; build a consistent habit.

Frustrations: Fear of injury from overexertion; overwhelmed by conflicting online advice.

Core Need: Simplicity & Safety. Needs conservative progression and clear guidance on when to push versus when to rest.

Emily Parker, 34
Management Consultant

The Performance Improver

Goal: Improve Half-Marathon PB; eventually run a full marathon.

Frustrations: Plans do not adapt when she is fatigued; rigid schedules clash with an unpredictable work calendar.

Core Need: Adaptive Flexibility. Needs recovery-aware scheduling that flexes with her daily reality.

Daniel Rodriguez, 39
Marketing Manager

The Competitive Athlete

Goal: Qualify for major international marathons (Boston, Berlin).

Frustrations: Limited advanced customization; lacks support for AM/PM double sessions and deep analytics.

Core Need: Professional-Grade Customization. Uses Garmin/HRV and expects elite-level coaching intelligence.

Strategic Synthesis

The Unifying Insight
While their specific goals range from simple injury prevention to elite HRV integration, all three personas share a core desire: They don't want to log runs—they want structured improvement.

The Friction
The current "one-size-fits-all" rigidity is actively failing these distinct needs.

The Complication: Rigid, overly aggressive plans create an injury trap that drives churn.

User Journey & Breakdown Points

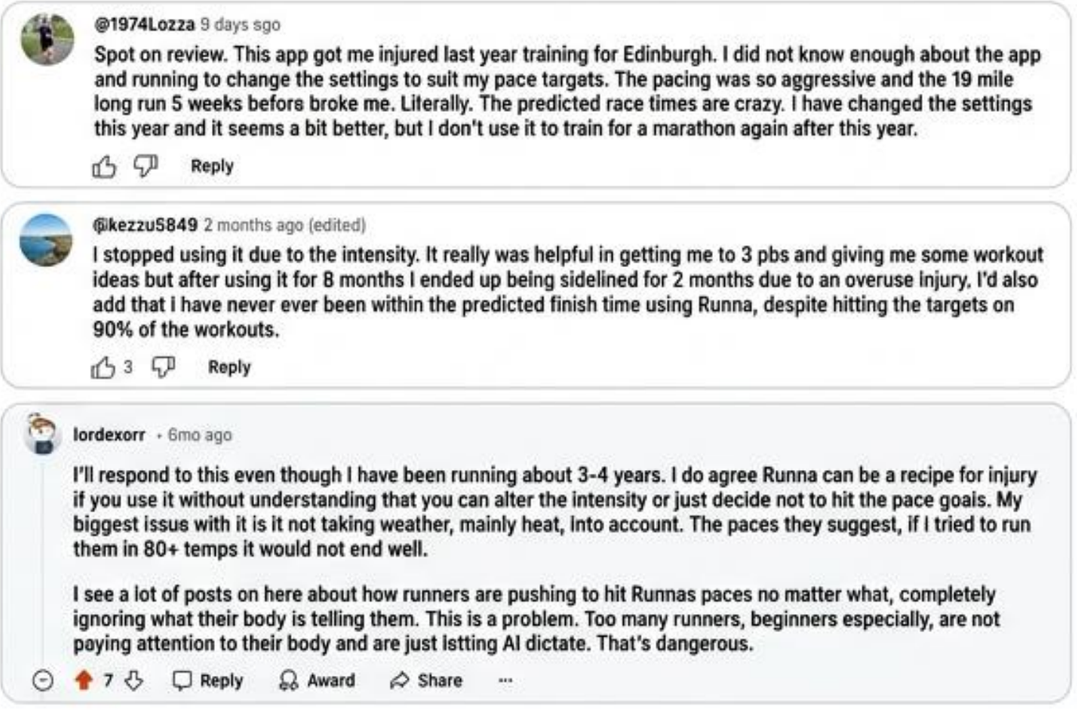

Stage 2: Onboarding
High drop-off if the initial plan looks intimidating.

Stage 3: Training Plan -> THE INJURY TRAP
Training intensity and pace targets escalate faster than beginner fitness can adapt. Rigid long-run volume jumps feel unrealistic.

Stage 4: During Run
Voice guidance feels robotic and lacks emotional encouragement.

Stage 5: Post-Run
Complex metrics require manual interpretation; users are left asking, "Should I rest tomorrow?"

Raw User Evidence (The Reality)

Pain Point Prioritization (BLUF)

P0 (Critical): Plans feel overly aggressive.

P0 (Critical): Limited adaptive coaching. The algorithm relies solely on initial pace inputs and ignores real-time dynamic body signals (HRV, sleep, fatigue).

MVP Strategy: Evolving from a static planner to a dynamic coach via Adaptive Mode.

Phase 1 Solution — Control vs. Adaptive Toggle

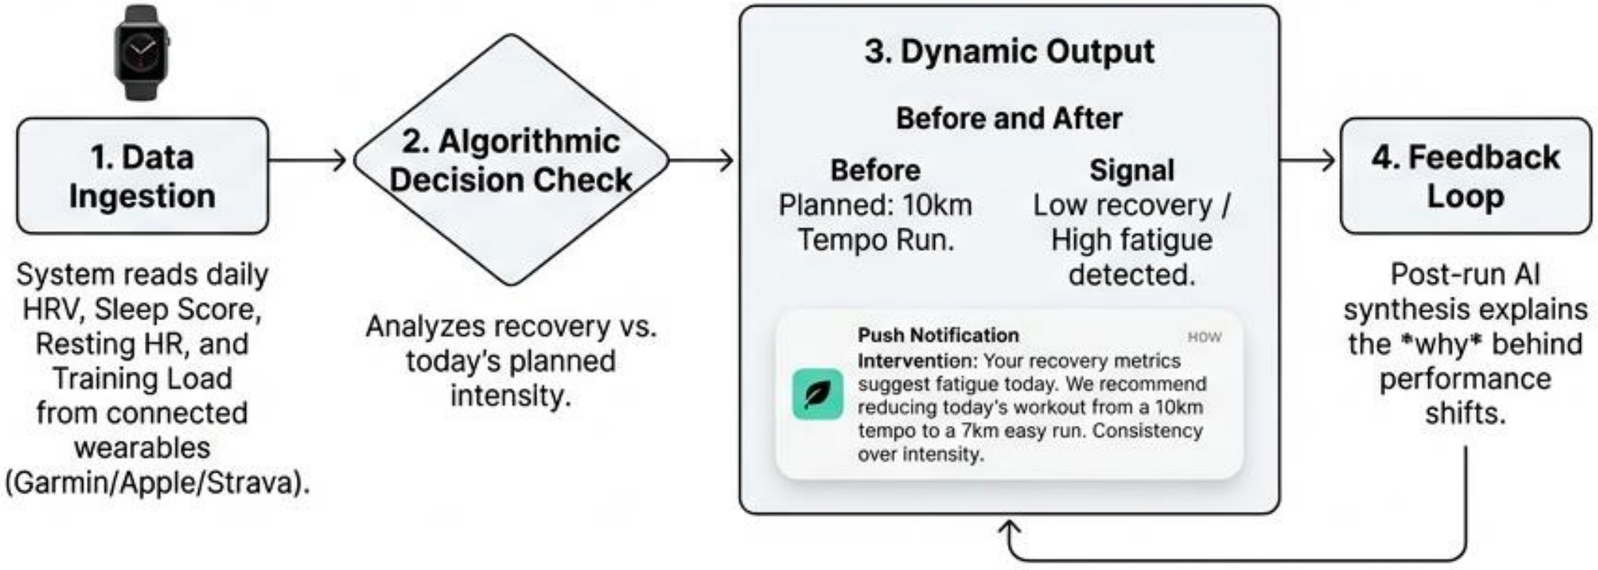

Mode A: Structured Plan (Control)

Fixed schedule, minimal changes. Ideal for the "Competitive Athlete" who strictly manages their own load and routines.

Mode B: Adaptive Coach (Dynamic)

Intelligent adjustments based on real-time recovery signals. Ideal for the "Beginner" and "Performance Improver" needing safety and flexibility.

The Adaptive Intelligence Engine

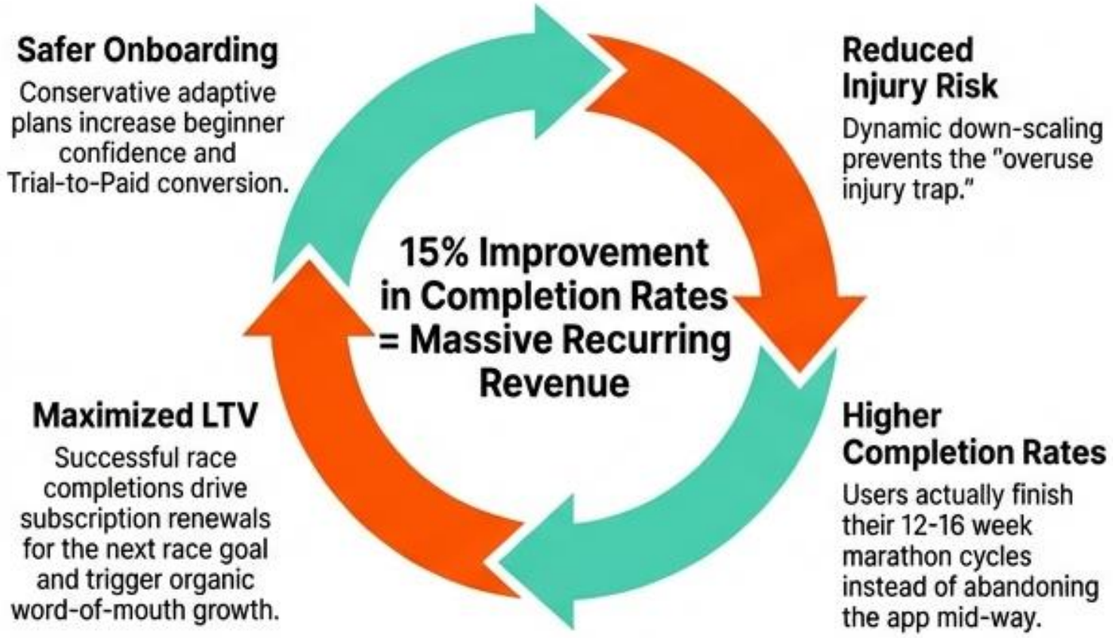

Strategic Rationale

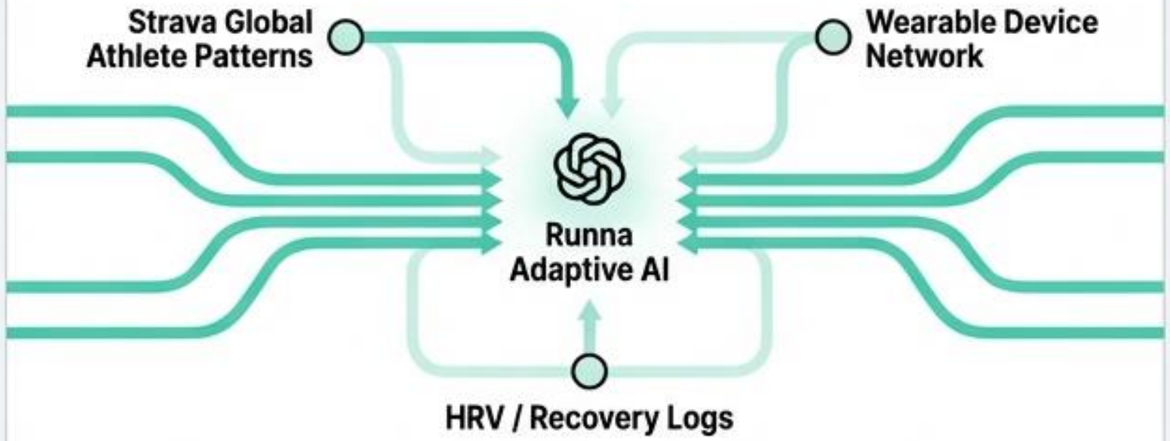

Feasibility vs. Impact: Very High Impact, Medium Effort. Directly targets the highest-churn pain point (injury) while serving multiple runner segments simultaneously.

Business Impact: Leveraging the Strava ecosystem to drive retention and unlock LTV.

The Retention Flywheel

The Strava Ecosystem Moat

Visualizing the force multiplier of the April 2025 Strava acquisition. Runna no longer operates in a silo. By tapping into Strava's unprecedented network of wearable data, Runna can train the Adaptive Coaching AI faster and more accurately than any standalone competitor, creating deep platform stickiness.

"The future of fitness apps is not tracking workouts. It is coaching behavior."

If Runna evolves into a product that understands bodily recovery, adapts in real-time, and explains its decisions, it ceases to be a mere training planner. It becomes the trusted running coach in your pocket.
